

COVID19 DUAL ANTIBODY TEST KIT

LATERAL FLOW
IMMUNOASSAY
ONE DROP BLOOD

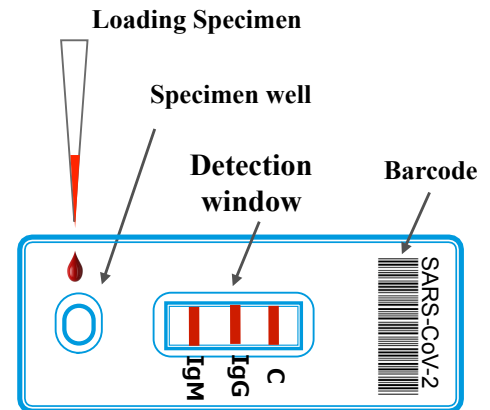

Schematic illustration of testing procedure for COVID19 IgG/IgM Dual Antibody Kit

TEST YOUR ANTIBODY

Single Use Onsite

Results are for the detection of **SARS-CoV-2** two antibodies. IgM antibodies to **SARS-CoV-2** are generally detectable in blood several days after initial infection, although levels over the course of infection are not well characterized. IgG antibodies to **SARS-CoV-2** become detectable later following infection. The IgG antibody is the most abundantly found immunoglobulin to be produced in response to a COVID-19 antigens and will be maintained in the body after initial exposure for long term response. Positive results for both IgG and IgM could occur after infection and can be indicative of acute or recent infection.

This stripe-based immunoassay could provide great potential in low-cost and POC application for **SARS-CoV-2** diagnosis.

Dual Antibodies IgG and IgM

Your Antibody vs Your Immunity
